Basic Refrigeration and Air Conditioning: P. N ...

Principles of Refrigeration. Liquids absorb heat when changed from liquid to gas. Gases give off heat when changed from gas to liquid. For an air conditioning system to operate with economy, the refrigerant must be used repeatedly. For this reason, all air conditioners use the same cycle of compression, condensation, expansion, and evaporation in a closed circuit.

Introduction and Basic Concepts of Refrigeration and Air Conditioning: First, let's understand a few things. Intensive properties do not depend on the size of the system e.g. pressure and temperature etc. Extensive properties depend on the size of the system e.g, volume, internal energy, enthalpy, etc.

Introduction and Basic Concepts of Refrigeration and Air ...

The main difference between refrigeration and air conditioning is that refrigeration, in general, refers to any process where thermal energy is taken away from a place and transferred to a place with a higher temperature. Air conditioning is a type of refrigeration where thermal energy is taken away from the air (typically in a room or a vehicle) in order to keep the air cooler. What is Refrigeration

Difference Between Refrigeration and Air Conditioning

Air conditioning and refrigeration are provided through the removal of heat. Heat can be removed through radiation, convection, or conduction. Refrigeration conduction media such as water, air, ice, and chemicals are referred to as refrigerants.

Refrigeration Basics is an introduction to the Refrigeration & Air Conditioning Trade and focuses on creating a solid foundation which can be built upon readily. Learning about refrigeration is a never ending process and well understood fundamentals make learning more advanced concepts much easier.

Refrigeration Basics - Home

A ton of refrigeration or air conditioning is the amount of heat needed to melt one ton of ice in 24 hours. The amount is 12,000 Btu. MBH- thousands of Btu per hour. Used as a method to simplify quantities. 340 MBH is easier to use in specifications than 340,000 Btu per hour.

Basic Thermodynamics for Refrigeration and Air ...

Air conditioners use refrigeration to chill indoor air, taking advantage of a remarkable physical law: When a liquid converts to a gas (in a process called phase conversion), it absorbs heat.

How Air Conditioners Work: Air-Conditioning Basics ...

In any central air conditioning unit we will have five basic mechanical components: a compressor, a condenser, an expansion device (metering device), an evaporator and a refrigeration copper tube that connects them. In the typical split-air conditioning system, the four basic components are separated into two sections indoor and outdoor.

At low temperatures there is only a small amount of radiation, and only minor temperature differences are noticed; therefore radiation has very little effect in actual process of refrigeration itself. But results of radiation from direct solar rays can cause an increased refrigeration load in a building air conditioning system.

In refrigeration, the apparatus supplies thermal energy from one place to a place of higher temperature whereas, in air conditioning, the thermal energy is taken from the air in order to cool the air. Naturally, thermal energy can be seen flowing from a higher temperature bearing place to a lower temperature bearing place.
