Principles of Helicopter Aerodynamics. Second Edition. The helicopter is truly a unique form of aircraft and a mastery of modern aeronautical engineering that fulfills a variety of civilian and military roles. The usefulness of the helicopter lies in its unique ability to take off and land vertically on almost any terrain, to hover stationary relative to the ground, and to fly forward, backward, or sideways.

Before talking about the aerodynamics of helicopters we first have to introduce a few basic principles of aerodynamics. In order to get aircrafts that are “ heavier than air ” off the ground a force has to act upwards that is as least equal to the weight of the aircraft. This force is called lift and is created by the wings.

Design principles. Each rotor produces both lift and torque about its center of rotation, as well as drag opposite to the vehicle's direction of flight. Quadcopters generally have two rotors spinning clockwise (CW) and two counterclockwise (CCW). Flight control is provided by independent variation of the speed and hence lift and torque of
