Many simple inequalities can be solved by adding, subtracting, multiplying or dividing both sides until you are left with the variable on its own. But these things will change direction of the inequality: Multiplying or dividing both sides by a negative number; Swapping left and right hand sides

Solving Inequalities - MATH

Solve the inequality: $8x - 2 > 0$. Solution. First of all, add both sides of the inequality by 2. $8x - 2 + 2 > 0 + 2$. $8x > 2$. Now, solve by dividing both sides of the inequality by 8 to get; $x > 2/8$. $x > 1/4$ Example 8. Solve the following inequality: $-5x > 100$. Solution. Divide both sides of the inequality by -5 and change the direction of the inequality symbol

Another commonly used, and arguably the most concise, method for describing inequalities and solutions to inequalities is called interval notation. With this convention, sets are built with parentheses or brackets, each having a distinct meaning. The solutions to $x \geq 4$ are represented as $[4, \infty)$.

The solutions for inequalities generally involve the same basic rules as equations. There is one exception, which we will soon discover. The first rule, however, is similar to that used in solving equations. If the same quantity is added to each side of an inequality, the results are unequal in the same order.

The solutions to linear inequalities can be expressed several ways: using inequalities, using a graph, or using interval notation. The steps to solve linear inequalities are the same as linear equations, except if you multiply or divide by a negative when solving for the variable, you must reverse the inequality symbol.
